Using the Basic Workflow with the SilkTest Open Agent

This tutorial provides a step-by-step introduction to using SilkTest Classic to test a Web application that uses dynamic object recognition. Dynamic object recognition enables you to write test cases that use XPath queries to find and identify objects.

For the sake of simplicity, this guide assumes that you have installed SilkTest and are using the Green Mountain Outpost (GMO) Web application, <http://demo.borland.com/gmopost/>.

For additional information about SilkTest Classic, including information about sample scripts and applications, refer to the SilkTest Classic Help located in **Start > Programs > Silk > SilkTest > Documentation > SilkTest Classic**.

Starting SilkTest Classic

Click **Start > Programs > Silk > SilkTest > Clients > SilkTest Classic**. SilkTest Classic opens.

Creating a New Project

The type of project that you select determines the default SilkTest Agent. For Web application projects, the Open Agent is automatically set as the default agent. SilkTest Classic uses the default agent when configuring an application and recording a testcase.

1. Choose **File > New Project**. The **New Project** dialog box opens.
2. Under **Rich Internet Applications**, click **Web**.
3. Click **OK**. The **Create Project** dialog box opens.
4. Type a project name and a description in the appropriate text boxes.
5. Click **OK** to save your project in the default location, `< SilkTest installation directory > \Project`.

If you do not want to save your project in the default location, click **Browse** and specify the folder in which you want to save your project.

SilkTest Classic creates your project and displays nodes on the **Files** and **Global** tabs for the files and resources associated with this project.

Configuring the Insurance Company Web Application

When you configure an application, SilkTest Classic automatically creates a base state for the application. An application's base state is the known, stable state that you expect the application to be in before each test begins execution, and the state the application can be returned to after each test has ended execution.

1. Click **Configure Application** on the **Basic Workflow** bar.
If you do not see **Configure Application** on the **Basic Workflow** bar, ensure that the default Agent is set to the Open Agent.
The **New Test Frame** dialog box opens.
2. Double-click **Web Site Test Configuration**.
The **New Web Site Configuration** page opens.

3. From the **Browser Type** list, select **Internet Explorer**.

You can use other supported browsers instead of Windows Internet Explorer to replay tests, but not to record tests.

4. Close all open browsers.
5. Click **Start new browser**.
6. In the **Browse to URL** field, specify <http://demo.borland.com/InsuranceWebExtJS>.
7. Click **Finish**.

The **Choose name and folder of the new frame file** page opens. SilkTest Classic configures the recovery system and names the corresponding file `frame.inc` by default.

8. Navigate to the location in which you want to save the frame file.
9. In the **File name** field, type the name for the frame file that contains the default base state and recovery system. Then, click **Save**.

SilkTest Classic automatically creates a base state for the application. By default, SilkTest Classic lists the caption of the main window of the application as the locator for the base state. When you configure an application, SilkTest Classic adds an include file based on the technology or browser type that you enable to the **Use files location** in the **Runtime Options** dialog box. For instance, if you configure an application that uses one of the supported browsers, SilkTest Classic adds the `xBrowser.inc` file to the **Runtime Options** dialog box.

SilkTest Classic opens the Web page. Record the test case whenever you are ready.

Recording a Test Case for the Insurance Company Web Site

1. Click **Record Testcase** on the **Basic Workflow** bar. The **Record Testcase** dialog box opens.
2. Type the name of your test case in the **Testcase name** field.

For example, type `ZipTest`.

Test case names are not case sensitive; they can be any length and consist of any combination of alphabetic characters, numerals, and underscore characters.

3. From the **Application State** list box, select **DefaultBaseState** to have the built-in recovery system restore the default base state before the test case begins executing. If you choose **DefaultBaseState** as the application state, the test case is recorded in the script file as: `testcase testcase_name ()`.
4. If you do not want SilkTest Classic to display the status window during playback when driving the application to the specified base state, uncheck the **Show AppState status window** check box.

Typically, you check this check box. However, in some circumstances it is necessary to hide the status window. For instance, the status bar might obscure a critical control in the application you are testing.

5. Click **Start Recording**. SilkTest Classic:

- Closes the **Record Testcase** dialog box.
- Starts your application, if it is not already running
- Removes the editor window from the display.
- Displays the **Recording status** window.
- Waits for you to take further action.

6. In the insurance company Web site, perform the following steps:

- a) From the **Select a Service or login** list box, select **Auto Quote**. The **Automobile Instant Quote** page opens.
- b) Type a zip code and email address in the appropriate fields, click an automobile type, and then click **Next**.
- c) Specify an age, click a gender and driving record type, and then click **Next**.

- d) Specify a year, make, and model, click the financial info type, and then click **Next**. A summary of the information you specified displays.
- e) Point to the Zip Code that you specified and press **Ctrl+Alt** to add a verification to the script. You can add a verification for any of the information that displays. The **Verify Properties** dialog box opens.
- f) Check the **textContents** check box and then click **OK**. A verification action is added to the script for the zip code text.

An action that corresponds with each step is recorded.

7. To review what you have recorded, click **Stop Recording** in the **Recording** window.

SilkTest Classic displays the **Record Testcase** dialog box, which contains the code that has been recorded for you.

8. Click **Paste to Editor**.

9. Click **File > Save**.

Replay the test to ensure that it works as expected. You can modify the test to make changes if necessary.

Replaying a Test Case for the Insurance Company Web Site

Replay a test to ensure that it works as expected.

1. Make sure that the test case you want to run is in the active window.
2. Click **Run Testcase** on the **Basic Workflow** bar.

SilkTest Classic displays the **Run Testcase** dialog box, which lists all the test cases contained in the current script.

3. Select the ZipTest test case.
4. To wait one second after each interaction with the application under test is executed, check the **Animated Run Mode (Slow-Motion)** check box.

Typically, you will only use this check box if you want to watch the test case run. For instance, if you want to demonstrate a test case to someone else, you might want to check this check box. Executions of the default base state and functions that include one of the following strings are not delayed:

- BaseStateExecutionFinished
- Connecting
- Verify
- Exists
- Is
- Get
- Set
- Print
- ForceActiveXEnum
- Wait
- Sleep

5. Click **Run**.

SilkTest Classic runs the test case and generates a results file. The results file describes whether the test passed or failed, and provides summary information.
